## Ideal mirror

## K-G equation and boundary condition

$\left(\partial_{\mathrm{t}}^{2}-\partial_{\mathrm{x}}^{2}+\mathrm{m}^{2}\right) \phi(\mathrm{t}, \mathrm{x})=0, \phi(\mathrm{t}, \mathrm{z}(\mathrm{t}))=0$

$(\mathrm{t}, \mathrm{z}(\mathrm{t}))$-trajectory of the ideal mirror

## Set up of the problem

- Expand field $\phi(\mathrm{t}, \mathrm{x})$ in terms of space-time harmonics according to the mirror trajectory $\mathrm{z}(\mathrm{t})$
- check the commutation relations of the field operator and its conjugate momentum
- obtain the free Hamiltonian via the creation and annihilation operators
- derive the expectation value of the stress-energy tensor

## Motivation

This model system evidently can provide insight into more sophisticated process,such as particle production in cosmological models and exploding blalck holes

## Mirror at rest

## Field and boundary condition

$$
\hat{\phi}(\mathrm{t}, \mathrm{x})=\mathrm{i} \int_{0}^{\infty} \frac{\mathrm{dk}}{2 \pi} \sqrt{\frac{2}{\omega}} \sin (\mathrm{kx})\left[\hat{\mathrm{a}}_{\mathrm{k}} \mathrm{e}^{-\mathrm{i} w \mathrm{t}}-\hat{\mathrm{a}}_{\mathrm{k}}^{\dagger} \mathrm{e}^{\mathrm{iwt}}\right], \hat{\phi}(\mathrm{t}, 0)=0
$$

$$
\begin{aligned}
& \quad\left[\hat{a}_{\mathrm{k}}, \hat{\mathrm{a}}_{\mathrm{k}^{\prime}}^{\dagger}\right]=2 \pi \delta\left(\mathrm{k}-\mathrm{k}^{\prime}\right) \\
& {[\hat{\phi}(\mathrm{t}, \mathrm{x}), \hat{\pi}(\mathrm{t}, \mathrm{y})]=\mathrm{i}[\delta(\mathrm{x}-\mathrm{y})-\delta(\mathrm{x}+\mathrm{y})]} \\
& \text { where } \hat{\pi}(\mathrm{t}, \mathrm{y})=\partial_{\mathrm{t}} \hat{\phi}(\mathrm{t}, \mathrm{y})
\end{aligned}
$$

- canonical momentum

## Mirror at rest

## The stress-energy tensor

$$
\mathrm{T}_{\mu \nu}=\frac{1}{2}\left(\partial_{\mu} \phi \partial_{\nu} \phi+\partial_{\nu} \phi \partial_{\mu} \phi\right)-\frac{1}{2} \mathrm{~g}_{\mu \nu}\left(\partial_{\alpha} \phi \partial^{\alpha} \phi+\mathrm{m}^{2} \phi^{2}\right), \partial^{\mu} \mathrm{T}_{\mu \nu}=0
$$

$$
\begin{gathered}
\mathrm{H}=\int_{0}^{\infty} \mathrm{T}_{\mathrm{tt}} \mathrm{dx}=\int_{0}^{+\infty} \frac{\mathrm{dk}}{2 \pi} \frac{\omega}{2}\left(\hat{a}_{\mathrm{k}} \hat{a}_{\mathrm{k}}^{\dagger}+\hat{\mathrm{a}}_{\mathrm{k}}^{\dagger} \hat{a}_{\mathrm{k}}\right) \\
\left\langle: \mathrm{T}_{\mu \nu}:\right\rangle=-\frac{1}{2 \pi} \mathrm{~m}^{2} \mathrm{~K}_{0}(2 \mathrm{mx})\left(\begin{array}{ll}
1 & 0 \\
0 & 0
\end{array}\right) .
\end{gathered}
$$

## Mirror moving with constant velocity

In this case consider the velocity $0<\beta<1, \phi(\mathrm{t},-\beta \mathrm{t})=0$

## Field

$$
\hat{\phi}(\mathrm{t}, \mathrm{x})=\mathrm{i} \int_{\gamma \beta \mathrm{m}}^{+\infty} \frac{\mathrm{dk}}{2 \pi} \frac{1}{\sqrt{2 \omega}} \hat{\mathrm{a}}_{\mathrm{k}}\left(\mathrm{e}^{-\mathrm{i} \omega \mathrm{t}-\mathrm{ikx}}-\mathrm{e}^{-\mathrm{i} \omega_{\mathrm{r}} \mathrm{t}+\mathrm{i} \mathrm{k}_{\mathrm{r}} \mathrm{x}}\right)+\text { h.c. }
$$

$$
\begin{aligned}
& {[\hat{\phi}(\mathrm{t}, \mathrm{x}), \hat{\pi}(\mathrm{t}, \mathrm{y})]=\mathrm{i}\left[\delta(\mathrm{x}-\mathrm{y})-\frac{1}{2} \delta\left[2 \gamma^{2} \beta(1-\beta) \mathrm{t}+(1-\beta)^{2} \gamma^{2} \mathrm{x}+\right.\right.} \\
& \left.\mathrm{y}]-\frac{1}{2} \delta\left[2 \gamma^{2} \beta(1+\beta) \mathrm{t}+(1+\beta)^{2} \gamma^{2} \mathrm{x}+\mathrm{y}\right]\right]
\end{aligned}
$$

$$
\begin{aligned}
& \omega_{\mathrm{r}}=\left(1+\beta^{2}\right) \gamma^{2} \omega-2 \beta \gamma^{2} \mathrm{k} \\
& \mathrm{k}_{\mathrm{r}}=2 \beta \gamma^{2} \omega+\left(1+\beta^{2}\right) \gamma^{2} \mathrm{k}
\end{aligned}
$$

## Mirror moving with constant velocity

$$
\mathrm{H}=\int_{-\beta \mathrm{t}}^{\infty} \mathrm{T}_{\mathrm{tt}} \mathrm{dx}=\frac{1}{2} \int_{-\beta \mathrm{t}}^{+\infty}\left[\left(\partial_{\mathrm{t}} \phi\right)^{2}-\phi \partial_{\mathrm{t}}^{2} \phi\right] \mathrm{dx}, \mathrm{P}=\int_{-\beta \mathrm{t}}^{\infty} \mathrm{dx} \mathrm{~T}_{\mathrm{tx}}
$$

Translation operator

$$
\mathrm{H}-\beta \mathrm{P}=\int_{\gamma \beta \mathrm{m}}^{\infty} \frac{\mathrm{dk}}{2 \pi} \frac{\gamma^{2}(\omega-\beta \mathrm{k})(\omega-\beta \mathrm{k}-\beta(1-\beta) \omega)}{2 \omega_{\mathrm{r}}}\left[\hat{\mathrm{a}}_{\mathrm{k}} \hat{\mathrm{a}}_{\mathrm{k}}^{\dagger}+\hat{\mathrm{a}}_{\mathrm{k}}^{\dagger} \hat{\mathrm{a}}_{\mathrm{k}}\right]
$$

Operator of the translations along the mirror is diagonal unlike the Hamiltonian and Momentum separately

For massless field

$$
\mathrm{H}-\beta \mathrm{P}=
$$

$$
(1-\beta) \int_{0}^{\infty} \frac{\mathrm{dk}}{2 \pi} \frac{\mathrm{k}}{2}\left[\mathrm{a}_{\mathrm{k}} \mathrm{a}_{\mathrm{k}}^{\dagger}+\mathrm{a}_{\mathrm{k}}^{\dagger} \mathrm{a}_{\mathrm{k}}\right]
$$

## Mirror moving with constant velocity

$$
\left\langle\mathrm{T}_{\mathrm{tx}}\right\rangle=\lim _{\varepsilon \rightarrow 0} \frac{1}{2}\left\langle\partial_{\mathrm{t}} \phi(\mathrm{t}, \mathrm{x}) \partial_{\mathrm{x}} \phi(\mathrm{t}+\mathrm{i} \varepsilon, \mathrm{x})+\partial_{\mathrm{x}} \phi(\mathrm{t}, \mathrm{x}) \partial_{\mathrm{t}} \phi(\mathrm{t}+\mathrm{i} \varepsilon, \mathrm{x})\right\rangle
$$

Vacuum average of tx-component

$$
\left\langle\mathrm{T}_{\mathrm{tx}}\right\rangle=-\frac{1}{2 \pi} \gamma^{2} \beta \mathrm{~m}^{2} \mathrm{~K}_{0}(2 \mathrm{~m} \gamma(\mathrm{x}+\beta \mathrm{t}))
$$

## No flux

For each fixed x , as $\mathrm{t} \rightarrow+\infty,\left\langle\mathrm{T}_{\mathrm{tx}}\right\rangle \rightarrow 0$
Boost the mirror at rest

$$
\left\langle\mathrm{T}_{\mathrm{tx}}\right\rangle=\beta \gamma^{2}\left(\left\langle: \mathrm{T}_{\mathrm{t}^{\prime} \mathrm{t}^{\prime}}:\right\rangle+\left\langle: \mathrm{T}_{\mathrm{x}^{\prime} \mathrm{x}^{\prime}}:\right\rangle\right)=-\frac{1}{2 \pi} \mathrm{~m}^{2} \beta \gamma^{2} \mathrm{~K}_{0}\left(2 \mathrm{mx}^{\prime}\right)
$$

## Non-ideal mirror

$$
\begin{array}{r}
\left(\partial_{\mathrm{t}}^{2}-\partial_{\mathrm{x}}^{2}+\mathrm{m}^{2}+\alpha \delta(\mathrm{x})\right) \mathrm{h}(\mathrm{t}, \mathrm{x})=0, \quad \alpha>0 \\
\mathrm{~h}(\mathrm{t},+0)=\mathrm{h}(\mathrm{t},-0) ; \partial_{\mathrm{x}} \mathrm{~h}(\mathrm{t},+0)-\partial_{\mathrm{x}} \mathrm{~h}(\mathrm{t},-0)=\alpha \mathrm{h}(\mathrm{t}, 0)
\end{array}
$$

## Modes

$$
\begin{aligned}
& \mathrm{h}_{\mathrm{k}>0}(\mathrm{t}, \mathrm{x})= \begin{cases}\frac{\mathrm{e}^{-\mathrm{i} \omega \mathrm{t}}}{\sqrt{2 \omega}}\left(\mathrm{e}^{-\mathrm{i} k x}-\frac{\alpha}{2 \mathrm{ik}+\alpha} \mathrm{e}^{\mathrm{i} k \mathrm{x}}\right) & \mathrm{x}<0 \\
\frac{\mathrm{e}^{-\mathrm{i} \omega \mathrm{t}}}{\sqrt{2 \omega}} \frac{2 i \mathrm{ik}}{2 \mathrm{ik+} \mathrm{\alpha}+\alpha} \mathrm{e}^{-\mathrm{i} k x} & \mathrm{x}>0\end{cases} \\
& \mathrm{h}_{\mathrm{k}<0}(\mathrm{t}, \mathrm{x})= \begin{cases}\frac{\mathrm{e}^{-\mathrm{i} \omega \mathrm{t}}}{\sqrt{2 \omega}}\left(\mathrm{e}^{-\mathrm{i} k x}+\frac{\alpha}{2 \mathrm{ik}-\alpha} \mathrm{e}^{\mathrm{i} k x}\right) & \mathrm{x}>0 \\
\frac{\mathrm{e}^{-\mathrm{i} \omega \mathrm{t}}}{\sqrt{2 \omega}} \frac{2 i k}{2 \mathrm{ik-} \mathrm{\alpha}} \mathrm{e}^{-\mathrm{i} k x} & \mathrm{x}<0\end{cases}
\end{aligned}
$$

## Non-ideal mirror

The quantized field

$$
\hat{\phi}(\mathrm{t}, \mathrm{x})=\int_{-\infty}^{+\infty} \frac{\mathrm{dk}}{2 \pi} \frac{\hat{a}_{\mathrm{k}} \mathrm{~h}(\mathrm{x}) \mathrm{e}^{\mathrm{i} \omega \mathrm{t}}+\hat{\mathrm{a}}_{\mathrm{k}}^{\dagger} \mathrm{h}^{*}(\mathrm{x}) \mathrm{e}^{-\mathrm{i} \omega \mathrm{t}}}{\sqrt{2 \omega}}
$$

Commutation relation

$$
\left[\hat{\phi}(\mathrm{t}, \mathrm{x}), \partial_{\mathrm{t}} \hat{\phi}(\mathrm{t}, \mathrm{y})\right]=\mathrm{i} \delta(\mathrm{x}-\mathrm{y})
$$

## Non-ideal mirror

## The Hamiltonian

$$
\begin{gathered}
\hat{\mathrm{H}}=\frac{1}{2} \int_{-\infty}^{+\infty} \mathrm{dx}\left[\left(\partial_{\mathrm{t}} \hat{\phi}\right)^{2}+\left(\partial_{\mathrm{x}} \hat{\phi}\right)^{2}+\mathrm{m}^{2} \hat{\phi}^{2}+\alpha \hat{\phi}^{2}(\mathrm{t}, 0)\right]= \\
=\int_{-\infty}^{+\infty} \frac{\mathrm{dk}}{2 \pi} \frac{\omega}{2}\left(\hat{a}_{\mathrm{k}} \hat{a}_{\mathrm{k}}^{\dagger}+\hat{\mathrm{a}}_{\mathrm{k}}^{\dagger} \hat{a}_{\mathrm{k}}\right)
\end{gathered}
$$

## Non-ideal mirror

The vacuum expectation value of the stress-energy tensor

$$
\begin{gathered}
\left\langle\mathrm{T}_{\mu \nu}\right\rangle=-\frac{1}{4 \pi} \eta_{\mu \nu}\left[\mathrm{M}^{2} \log \Lambda-2 \alpha \delta(\mathrm{x}) \frac{\arctan \left(\sqrt{\frac{4 \mathrm{~m}^{2}}{\alpha^{2}}-1}\right)}{\sqrt{\frac{4 \mathrm{~m}^{2}}{\alpha^{2}}-1}}\right]+ \\
+\mathrm{F}(\mathrm{~m}, \mathrm{M}, \mathrm{x})\left(\begin{array}{ll}
1 & 0 \\
0 & 0
\end{array}\right) .
\end{gathered}
$$

$$
\begin{aligned}
& \mathrm{F}(\mathrm{~m}, \mathrm{M}, \mathrm{x})=\mathrm{m}^{2} \int_{-\infty}^{+\infty}\left[\theta(-\mathrm{x}) \theta(\mathrm{k})\left(\frac{\alpha}{2 \mathrm{ik}-\alpha} \mathrm{e}^{-2 \mathrm{ikx}}-\frac{\alpha}{2 \mathrm{ik+} \mathrm{\alpha}} \mathrm{e}^{2 \mathrm{ikx}}\right)+\right. \\
& \left.+\theta(\mathrm{x}) \theta(-\mathrm{k})\left(\frac{\alpha}{2 \mathrm{ik}-\alpha} \mathrm{e}^{2 \mathrm{ikx}}-\frac{\alpha}{2 \mathrm{ik+} \mathrm{\alpha}} \mathrm{e}^{-2 \mathrm{ikx}}\right)\right] \frac{\mathrm{dk}}{4 \pi \omega}-(\mathrm{m} \rightarrow \mathrm{M})
\end{aligned}
$$

## Conclusions

- In case of the ideal mirror, the field operator and its conjugate momentum do not obey the canonical commutation relations
- in the presence of moving mirrors the diagonal form has the $\hat{\mathrm{H}}-\beta \hat{\mathrm{P}}$ operator rather than $\hat{\mathrm{H}}$ itself
- In the presence of a mirror moving with constant velocity the expectation value of the stress-energy tensor has a non-diagonal contribution
- In the case of non-ideal mirror the commutation relations of the field operator and its conjugate momentum have their canonical form, as it should be in proper physical situations

## Thank you for your attention!
