

Perturbations of black holes in shift-symmetric scalar-tensor theories

Tsutomu Kobayashi

Rikkyo University

Based on work with

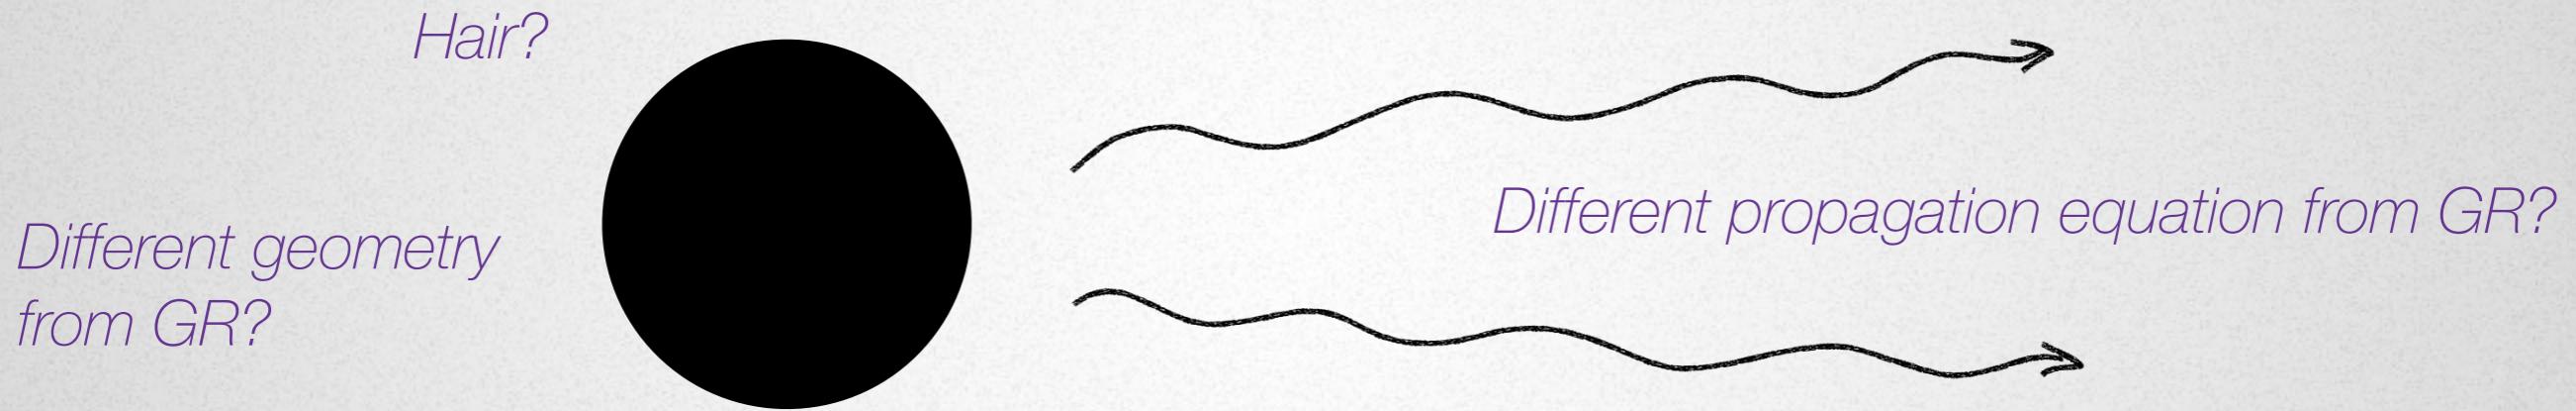

Keitaro Tomikawa (Rikkyo)

Phys.Rev.D 103 (2021) 8, 084041 [2101.03790]

Introduction

- Gravitational waves (GWs) from black holes (BHs): important tool for testing gravity in strong field regime

- This work: Odd-parity (axial) perturbations (~ GWs) of a BH with time-dependent scalar hair in general (shift-symmetric) scalar-tensor theories
 - General form of the Lagrangian for odd modes?

Introduction

- EFT approach is useful for **static** and spherically symmetric background in scalar-tensor theories

$$g_{\mu\nu} = g_{\mu\nu}(r), \quad \phi = \phi(r)$$

Kase *et al.* (2014); Franciolini *et al.* (2019); Kuntz *et al.* (2020)

- Our background:

$$g_{\mu\nu} = g_{\mu\nu}(r), \quad \phi = \mu t + \psi(r)$$

configuration allowed in **shift-symmetric** theories:

$$\mathcal{L}(\cancel{\phi}, \partial_\mu \phi, \dots)$$

- Time dependence breaks the usual assumption of EFT
- Better to start from covariant action

General scalar–tensor theories

Horndeski theory

- GR

The most general scalar-tensor theory with 2nd-order EOMs

- free from Ostrogradsky instability by construction Horndeski (1974)

$$\mathcal{L} = F_0(\phi, X) + F_1(\phi, X)\square\phi + F_2(\phi, X)R + F_{2,X} [(\square\phi)^2 - \phi_{\mu\nu}\phi^{\mu\nu}] + \cdots$$

$$X = -\frac{1}{2}g^{\mu\nu}\phi_\mu\phi_\nu, \quad \phi_\mu = \nabla_\mu\phi$$

$$\phi_{\mu\nu} = \nabla_\mu\nabla_\nu\phi$$

General scalar–tensor theories

Horndeski theory

- GR

The most general scalar-tensor theory with 2nd-order EOMs

- free from Ostrogradsky instability by construction

Horndeski (1974)

$$\mathcal{L} = F_0(\cancel{\phi}, X) + F_1(\cancel{\phi}, X)\square\phi + F_2(\cancel{\phi}, X)R + F_{2,X} [(\square\phi)^2 - \phi_{\mu\nu}\phi^{\mu\nu}] + \cdots$$

shift symmetry

$$X = -\frac{1}{2}g^{\mu\nu}\phi_\mu\phi_\nu, \quad \phi_\mu = \nabla_\mu\phi$$

$$\phi_{\mu\nu} = \nabla_\mu\nabla_\nu\phi$$

General scalar–tensor theories

DHOST

Horndeski theory

- GR

(Degenerate Higher-Order Scalar-Tensor Theory)

Healthy theories beyond Horndeski

- Higher-order EOMs, but **degenerate**

Langlois & Noui (2015);
Crisostomi *et al.* (2016);
Ben Achour *et al.* (2016)

metric + single scalar, Ostrogradsky-stable

2 + 1 DOFs

DHOST theories

Langlois & Noui (2015);
Crisostomi *et al.* (2016);
Ben Achour *et al.* (2016)

$$\mathcal{L} = F_0(X) + F_1(X)\square\phi$$

↓ all possible terms of the form $(\nabla\nabla\phi)^2$

$$+ F_2(X)R + \boxed{A_1(X)\phi_{\mu\nu}\phi^{\mu\nu} + \cdots + A_5(X)(\phi^\mu\phi_{\mu\nu}\phi^\nu)^2}$$
$$+ F_3(X)G_{\mu\nu}\phi^{\mu\nu} + \boxed{B_1(X)(\square\phi)^3 + \cdots + B_{10}(X)(\phi^\mu\phi_{\mu\nu}\phi^\nu)^3}$$

↑ all possible terms of the form $(\nabla\nabla\phi)^3$

Degeneracy conditions:
algebraic relations among functions to eliminate Ostrogradsky ghost

DHOST theories

Langlois & Noui (2015);
Crisostomi *et al.* (2016);
Ben Achour *et al.* (2016)

$$\mathcal{L} = F_0(X) + F_1(X)\square\phi$$

↓

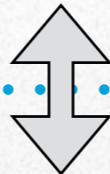

$$+ F_2(X)R + \boxed{A_1(X)\phi_{\mu\nu}\phi^{\mu\nu} + \cdots + A_5(X)(\phi^\mu\phi_{\mu\nu}\phi^\nu)^2}$$
$$+ F_3(X)G_{\mu\nu}\phi^{\mu\nu} + \boxed{B_1(X)(\square\phi)^3 + \cdots + B_{10}(X)(\phi^\mu\phi_{\mu\nu}\phi^\nu)^3}$$

↑

all possible terms of the form $(\nabla\nabla\phi)^2$

all possible terms of the form $(\nabla\nabla\phi)^3$

Degeneracy conditions:
algebraic relations among functions to eliminate Ostrogradsky ghost

Extensions of DHOST theories: degeneracy conditions may be relaxed

- U-DHOST:
degenerate only in unitary gauge → no propagating ghost De Felice *et al.* (2018)
- Scordatura (detuned DHOST):
not problematic from EFT viewpoint Motohashi & Mukohyama (2020)

Background examples

$$ds^2 = -A(r)dt^2 + \frac{dr^2}{B(r)} + r^2 (\mathrm{d}\theta^2 + \sin^2 \theta \mathrm{d}\varphi^2), \quad \phi = \mu t + \psi(r)$$

- Stealth solutions in Horndeski and DHOST theories

$$A = B = 1 - \frac{r_h}{r}, \quad X = \text{const.}$$

Mukohyama (2005); Babichev & Charmousis (2014); TK & Tanahashi (2014); Babichev *et al.* (2016); Ben Achour& Liu (2019); Motohashi & Minamitsuji (2019); Minamitsuji & Edholm (2019); ...

- Non-stealth, $X = X(r) \neq \text{const.}, \dots$

Rinaldi (2012); Babichev *et al.* (2017); Minamitsuji & Edholm (2020); ...

BH perturbations in scalar-tensor theories

- Horndeski, $\phi = \phi(r)$ TK, Motohashi, Suyama (2012, 2014)
- Horndeski, $\phi = \mu t + \psi(r)$ Ogawa, TK, Suyama (2016); Takahashi & Suyama (2017); Khoury *et al.* (2020)
- Quadratic DHOST, $\phi = \mu t + \psi(r)$ Takahashi, Motohashi, Minamitsuji (2019); de Rham & Zhang (2019); Langlois, Noui, Roussille 2103.14750
- EFT, $\phi = \phi(r)$ Kase *et al.* (2014); Franciolini *et al.* (2019); Kuntz *et al.* (2020)
- This work: Odd modes, cubic ~~DHOST~~ + matter, $\phi = \mu t + \psi(r)$
 - Odd modes (~GWs) are healthy even without degeneracy
(Degeneracy removes ghost in “scalar” sector)
 - Can be applied to U-DHOST and scordatura theories

Odd-parity perturbations in Regge–Wheeler gauge

$g_{\mu\nu} = \bar{g}_{\mu\nu}(r) + h_{\mu\nu}$, where

$$h_{t\theta} = -\frac{1}{\sin \theta} \sum_{\ell=2}^{\infty} \sum_{m=-\ell}^{\ell} h_0^{(\ell m)}(t, r) \partial_{\varphi} Y_{\ell m}, \quad h_{t\varphi} = \dots h_0^{(\ell m)} \dots,$$

$$h_{r\theta} = \dots h_1^{(\ell m)} \dots, \quad h_{r\varphi} = \sin \theta \sum_{\ell=2}^{\infty} \sum_{m=-\ell}^{\ell} h_1^{(\ell m)}(t, r) \partial_{\theta} Y_{\ell m},$$

$$h_{\theta\theta} = h_{\theta\varphi} = h_{\varphi\varphi} = 0 \leftarrow \text{gauge}$$

Source term (energy-momentum tensor):

$$T_{t\theta} = -\frac{1}{\sin \theta} \sum_{\ell=2}^{\infty} \sum_{m=-\ell}^{\ell} S_0^{(\ell m)}(t, r) \partial_{\varphi} Y_{\ell m}, \quad T_{t\varphi} = \dots S_0^{(\ell m)} \dots,$$

$$T_{r\theta}, T_{r\varphi} \supset S_1^{(\ell m)}(t, r),$$

$$T_{\theta\theta}, T_{\theta\varphi}, T_{\varphi\varphi} \supset S_2^{(\ell m)}(t, r)$$

$$\mathcal{L} = \mathcal{L}^{\text{DHOST}} + \frac{1}{2} h^{\mu\nu} T_{\mu\nu}$$

minimally-coupled matter

General form of Lagrangian

$$S = \sum_{\ell=2}^m \sum_{m=-\ell}^{\ell} \int dt dr \left[\mathcal{L}_{\ell m}^{(2)} + \mathcal{L}_{\ell m}^{\text{source}} + \text{c.c.} \right], \quad \text{where}$$

$$\mathcal{L}_{\ell m}^{(2)} = \frac{1}{2r^2} \left\{ [2(ra_3)' + a_1] |h_0|^2 - a_2 |h_1|^2 + r^2 a_3 \left(|\dot{h}_1|^2 - 2\dot{h}_1^* h_0' + |h_0'|^2 + \frac{4}{r} \dot{h}_1^* h_0 \right) + 2a_4 h_1^* h_0 \right\}$$

$$\mathcal{L}_{\ell m}^{\text{source}} = -\frac{\ell(\ell+1)}{2} \left(\frac{h_0^* S_0}{\sqrt{AB}} - \sqrt{AB} h_1^* S_1 \right)$$

General form of Lagrangian

$$S = \sum_{\ell=2}^m \sum_{m=-\ell}^{\ell} \int dt dr \left[\mathcal{L}_{\ell m}^{(2)} + \mathcal{L}_{\ell m}^{\text{source}} + \text{c.c.} \right], \quad \text{where}$$

$$\mathcal{L}_{\ell m}^{(2)} = \frac{1}{2r^2} \left\{ \underbrace{[2(ra_3)' + a_1] |h_0|^2 - a_2 |h_1|^2}_{\text{Same structure as the EFT result}} + r^2 a_3 \left(|\dot{h}_1|^2 - 2\dot{h}_1^* h_0' + |h_0'|^2 + \frac{4}{r} \dot{h}_1^* h_0 \right) + 2a_4 h_1^* h_0 \right\}$$

↓

New
 $a_4 \propto \mu$

$$\mathcal{L}_{\ell m}^{\text{source}} = -\frac{\ell(\ell+1)}{2} \left(\frac{h_0^* S_0}{\sqrt{AB}} - \sqrt{AB} h_1^* S_1 \right)$$

General form of Lagrangian

$$S = \sum_{\ell=2}^m \sum_{m=-\ell}^{\ell} \int dt dr \left[\mathcal{L}_{\ell m}^{(2)} + \mathcal{L}_{\ell m}^{\text{source}} + \text{c.c.} \right], \quad \text{where}$$

$$\mathcal{L}_{\ell m}^{(2)} = \frac{1}{2r^2} \left\{ \underbrace{[2(ra_3)' + a_1] |h_0|^2 - a_2 |h_1|^2}_{\text{Same structure as the EFT result}} + r^2 a_3 \left(|\dot{h}_1|^2 - 2\dot{h}_1^* h_0' + |h_0'|^2 + \frac{4}{r} \dot{h}_1^* h_0 \right) + 2a_4 h_1^* h_0 \right\}$$

↓

New
 $a_4 \propto \mu$

$$a_{1,2,3,4} = a_{1,2,3,4}(r) \supset \underbrace{F_2, F_3, A_1, B_2, B_3, B_6}_{\text{Coefficients of terms built out of curvature tensors, } \phi_{\mu\nu}\phi^{\mu\nu}, \text{ and } \phi_\mu^\nu\phi_\nu^\rho\phi_\rho^\mu}$$

Coefficients of terms built out of curvature tensors, $\phi_{\mu\nu}\phi^{\mu\nu}$, and $\phi_\mu^\nu\phi_\nu^\rho\phi_\rho^\mu$

Master variable

Introduce an auxiliary field $\chi = \chi^{(\ell m)}(t, r)$ and rewrite the Lagrangian as

$$\mathcal{L}_{\ell m}^{(2)} = \frac{1}{2r^2} \left[a_1|h_0|^2 - a_2|h_1|^2 + a_4 h_1^* h_0 + 2r^2 a_3 \chi^* \left(-\frac{1}{2}\chi + \dot{h}_1 - h'_0 + \frac{2}{r}h_0 \right) \right]$$

$\delta h_0, \delta h_1 \rightarrow$ Constraint eqs. $h_0 = \dots, h_1 = \dots$

$$\mathcal{L}_{\ell m}^{(2)} = \frac{r^2}{4(\ell-1)(\ell+2)} \left\{ b_1|\dot{\chi}|^2 - b_2|\chi'|^2 + 2b_3\dot{\chi}^*\chi' - \left[\frac{\ell(\ell+1)}{r^2} a_3 + (\dots) \right] |\chi|^2 \right\}$$

Stability
 $a_3 > 0$

\rightarrow Generalized Regge-Wheeler equation for χ

RW equation & effective metric

RW equation can be written in the form

$$Z^{\mu\nu} D_\mu D_\nu \left(\frac{\tilde{\chi}}{r} \right) - V \frac{\tilde{\chi}}{r} = (\dots) S_{\text{odd}}$$
$$\frac{\tilde{\chi}}{r} \propto \frac{a_3}{(a_1 a_2 + a_4^2)^{1/4}} \chi$$

Effective metric for gravitons — in general, $Z_{\mu\nu} \neq \bar{g}_{\mu\nu}$

$$Z_{\mu\nu} dx^\mu dx^\nu = \frac{-a_2 dt^2 - 2a_4 dt dr + a_1 dr^2}{(\ell - 1)(\ell + 2)a_3} + r^2(d\theta^2 + \sin^2 \theta d\varphi^2)$$

$\overset{a_4 \propto \mu}{\swarrow}$ ↑ ↙
gravitons photons

$Z_{\mu\nu} = \bar{g}_{\mu\nu}$ in theories with $c_{\text{GW}} = 1$ for cosmological tensor modes

Effective metric & stability

Effective metric can be put into diagonal form in terms of $d\tau = dt + \frac{a_4}{a_2} dr$

$$\rightarrow Z_{\mu\nu} dx^\mu dx^\nu = \frac{1}{(\ell - 1)(\ell + 2)a_3} \left[-a_2 d\tau^2 + \frac{(a_1 a_2 + a_4^2)}{a_2} dr^2 \right] + r^2(d\theta^2 + \sin^2 \theta d\varphi^2)$$

Horizon for gravitons: $a_2(r_g) = 0$

Horizon for photons: $A(r_h) = B(r_h) = 0$

Stability condition proposed by Takahashi, Motohashi, Minamitsuji (2019),

$a_2 > 0$, is in fact not related to stability

$a_2 = 0$: inner boundary

Example 1: Stealth Schwarzschild in quadratic DHOST theory

Motohashi & Minamitsuji (2019); Takahashi, Motohashi, Minamitsuji (2019)

$$A = B = 1 - \frac{r_h}{r}, \quad X = X_0 = \text{const.}$$

Effective metric for gravitons (~ Schwarzschild with $r_g \neq r_h$):

$$Z_{\mu\nu} dx^\mu dx^\nu = -\frac{1 - r_g/r}{1 + \mathcal{A}} d\tau^2 + \frac{dr^2}{1 - r_g/r} + r^2 d\Omega^2$$

where

$$r_g := (1 + \mathcal{A})r_h, \quad \mathcal{A} := \frac{2X_0 A_1(X_0)}{F_2(X_0)} \quad (= \text{const.})$$

Potential: $\tilde{V} = \frac{1 - r_g/r}{1 + \mathcal{A}} \left[\frac{\ell(\ell+1)}{r^2} - \frac{3r_g}{r^3} \right] \quad \sim \text{RW in GR with } r_g \neq r_h$

Example 2: Stealth Schwarzschild in cubic DHOST theory

Minamitsuji & Edholm (2019)

$$A = B = 1 - \frac{r_h}{r}, \quad X = X_0 = \text{const.}$$

Effective metric for gravitons:

($A_1(X_0) = 0$ is assumed)

$$Z_{\mu\nu} dx^\mu dx^\nu = -f(r)d\tau^2 + \frac{g(r)}{f(r)}dr^2 + r^2 d\Omega^2$$

where

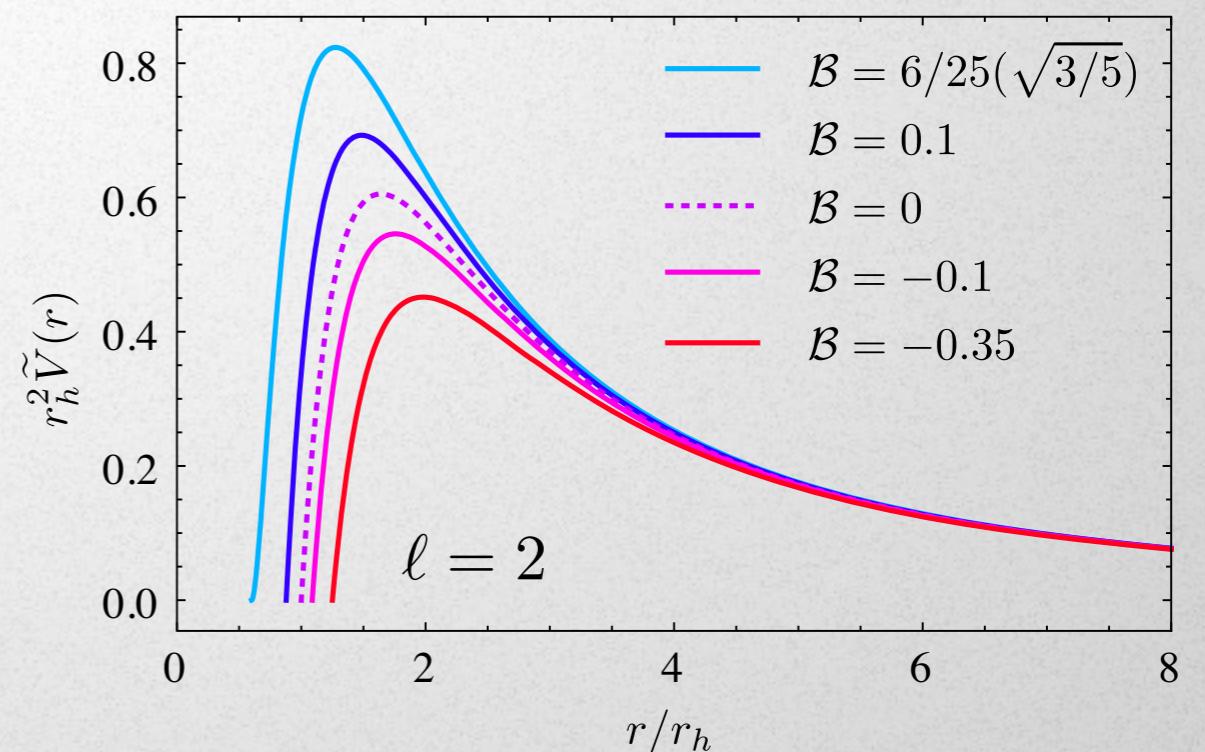

$$f(r) = 1 - \frac{r_h}{r} + \mathcal{B} \left(\frac{r_h}{r} \right)^{5/2},$$

$$g(r) = 1 - \mathcal{B} \left(\frac{r_h}{r} \right)^{3/2},$$

$$\mathcal{B} = \frac{81}{2} \frac{\mu^3}{r_h} \frac{B_1(X_0)}{F_2(X_0)} \quad (= \text{const.})$$

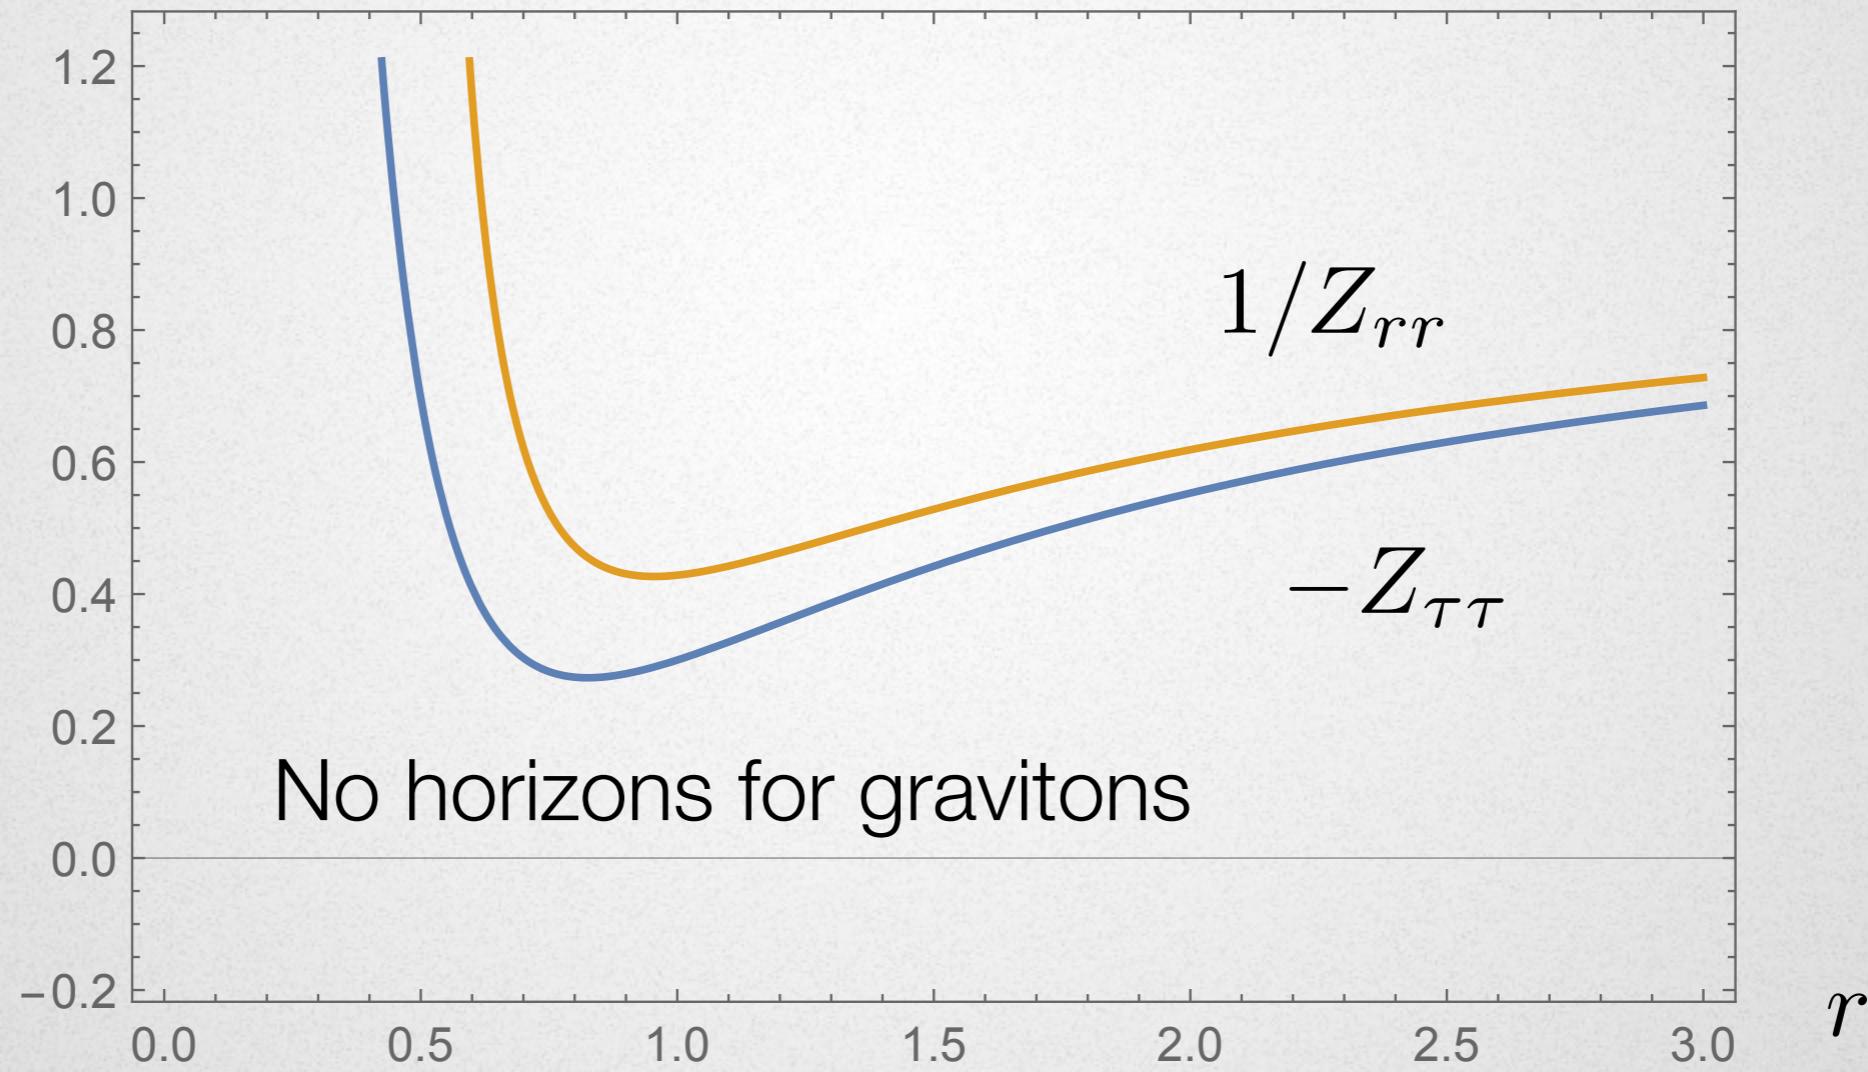

$$\tau \rightarrow t, \quad Z_{\mu\nu} \rightarrow \bar{g}_{\mu\nu}^{\text{Sch.}} \quad \text{for} \quad r \gg r_h$$

Potential:

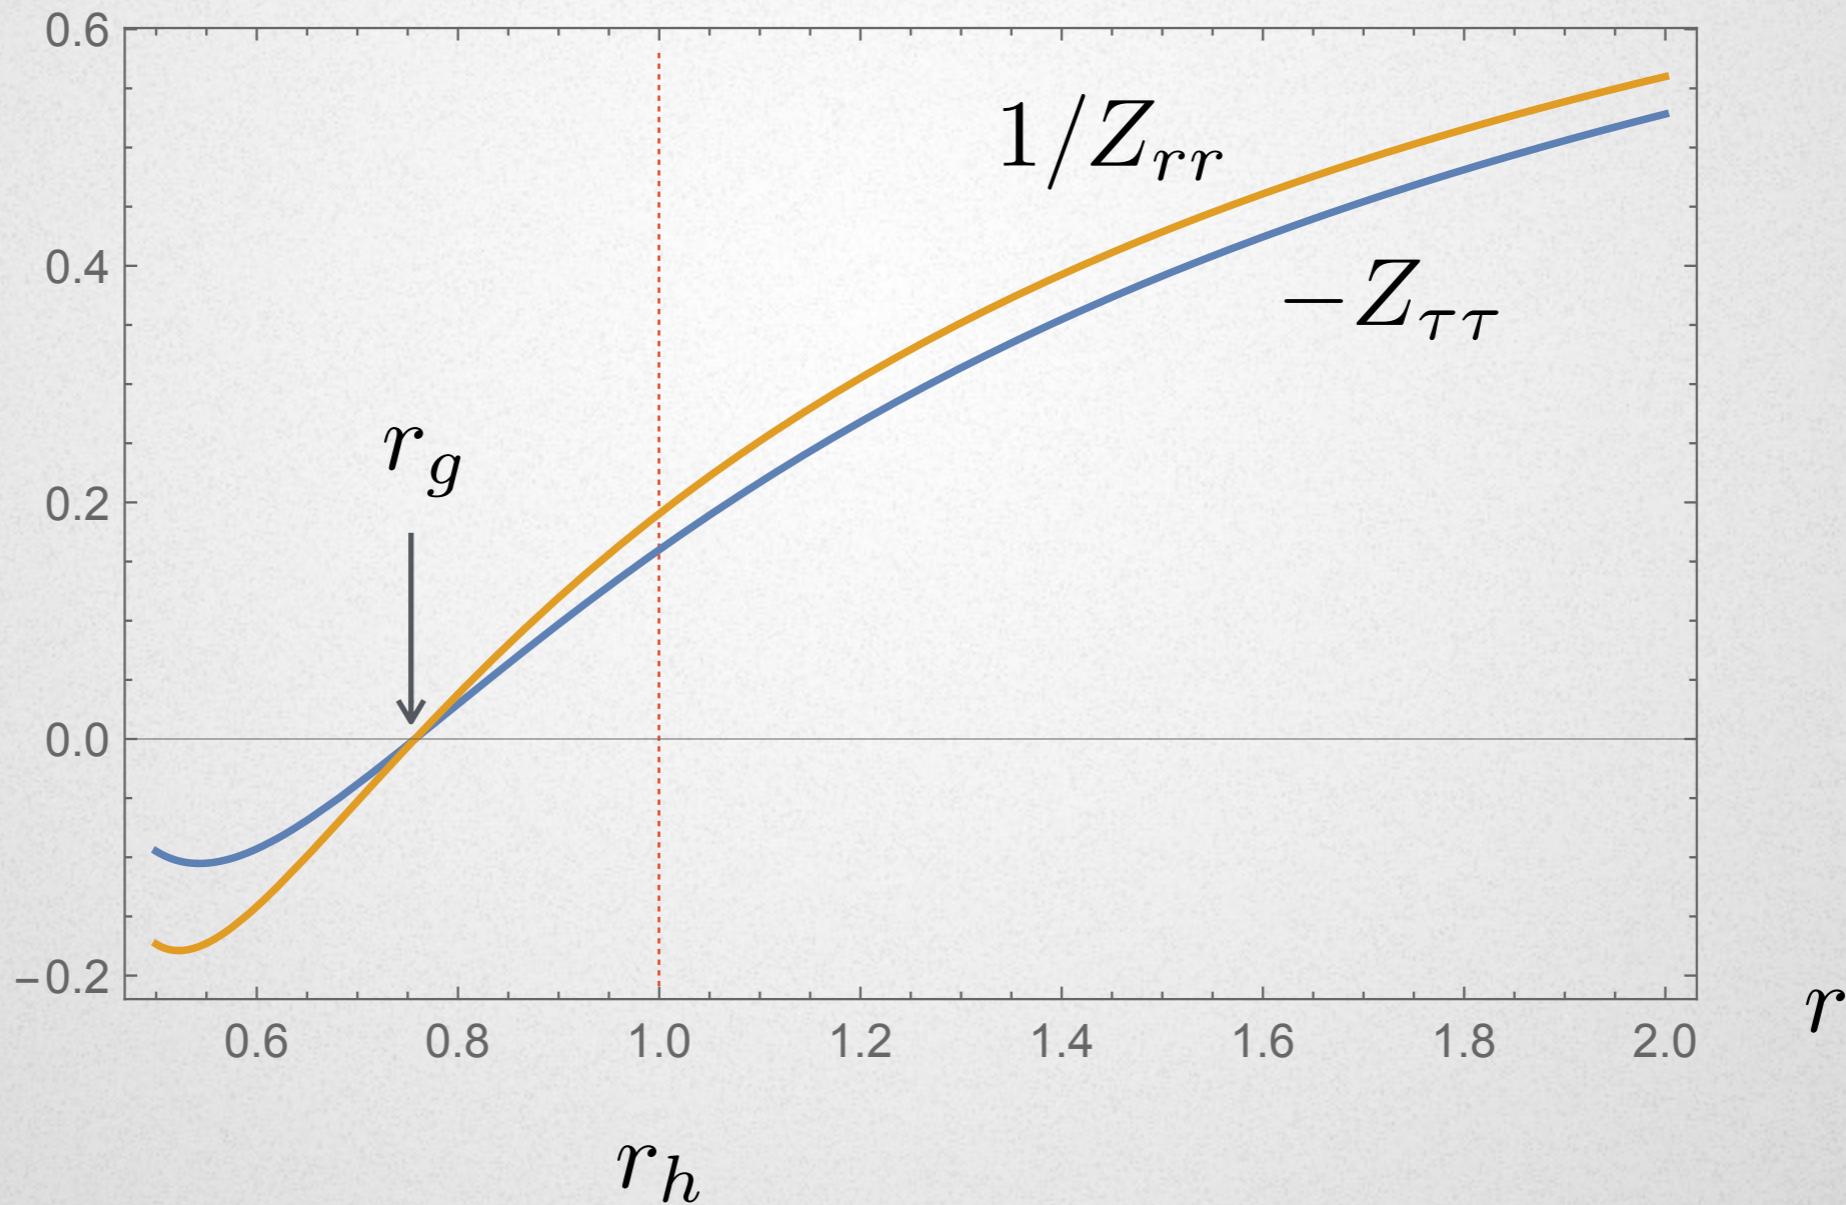

Geometry of Minamitsuji- Edholm solution for gravitons

$$\mathcal{B} > \frac{6}{25} \sqrt{\frac{3}{5}} \simeq 0.186$$

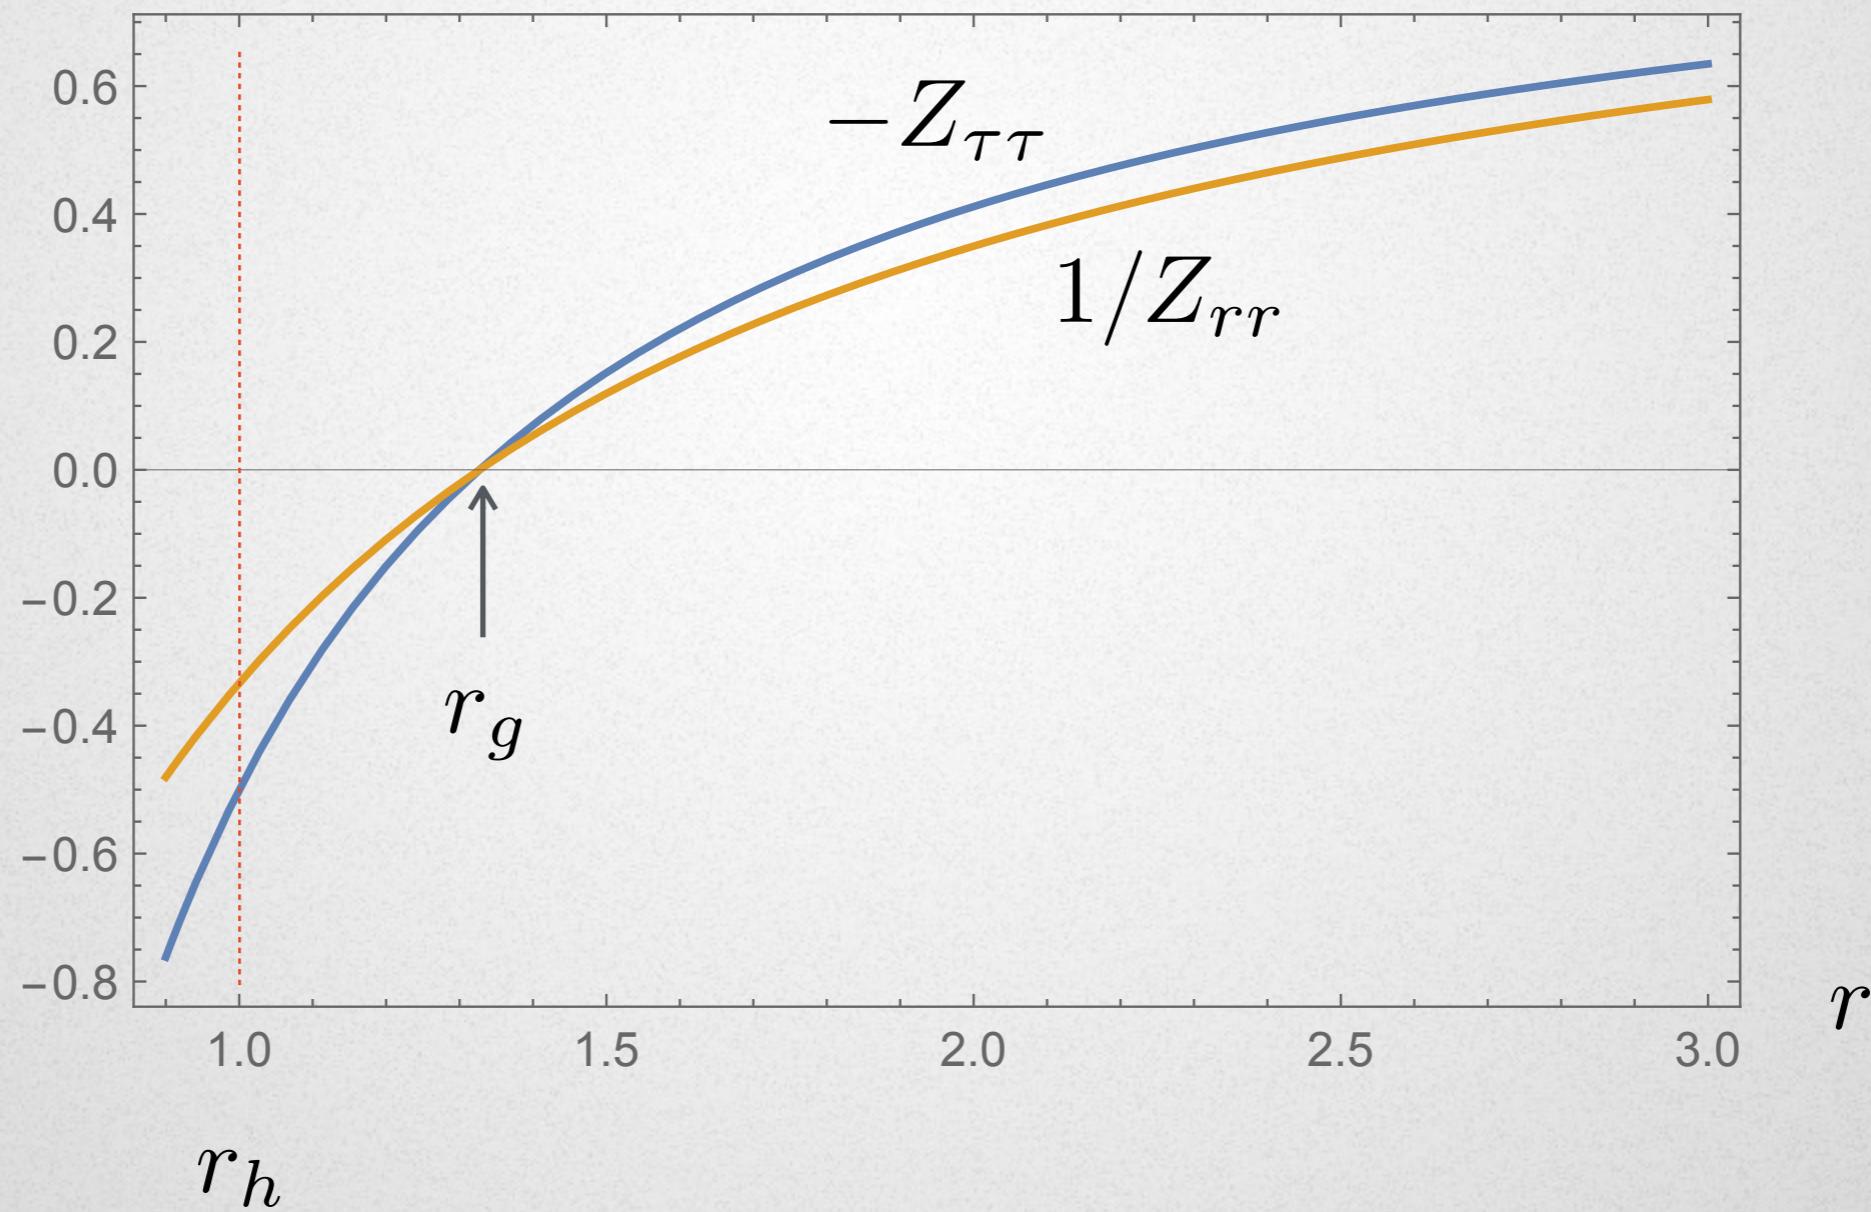

Geometry of Minamitsuji– Edholm solution for gravitons

$$0 < \mathcal{B} \leq \frac{6}{25} \sqrt{\frac{3}{5}} \simeq 0.186$$

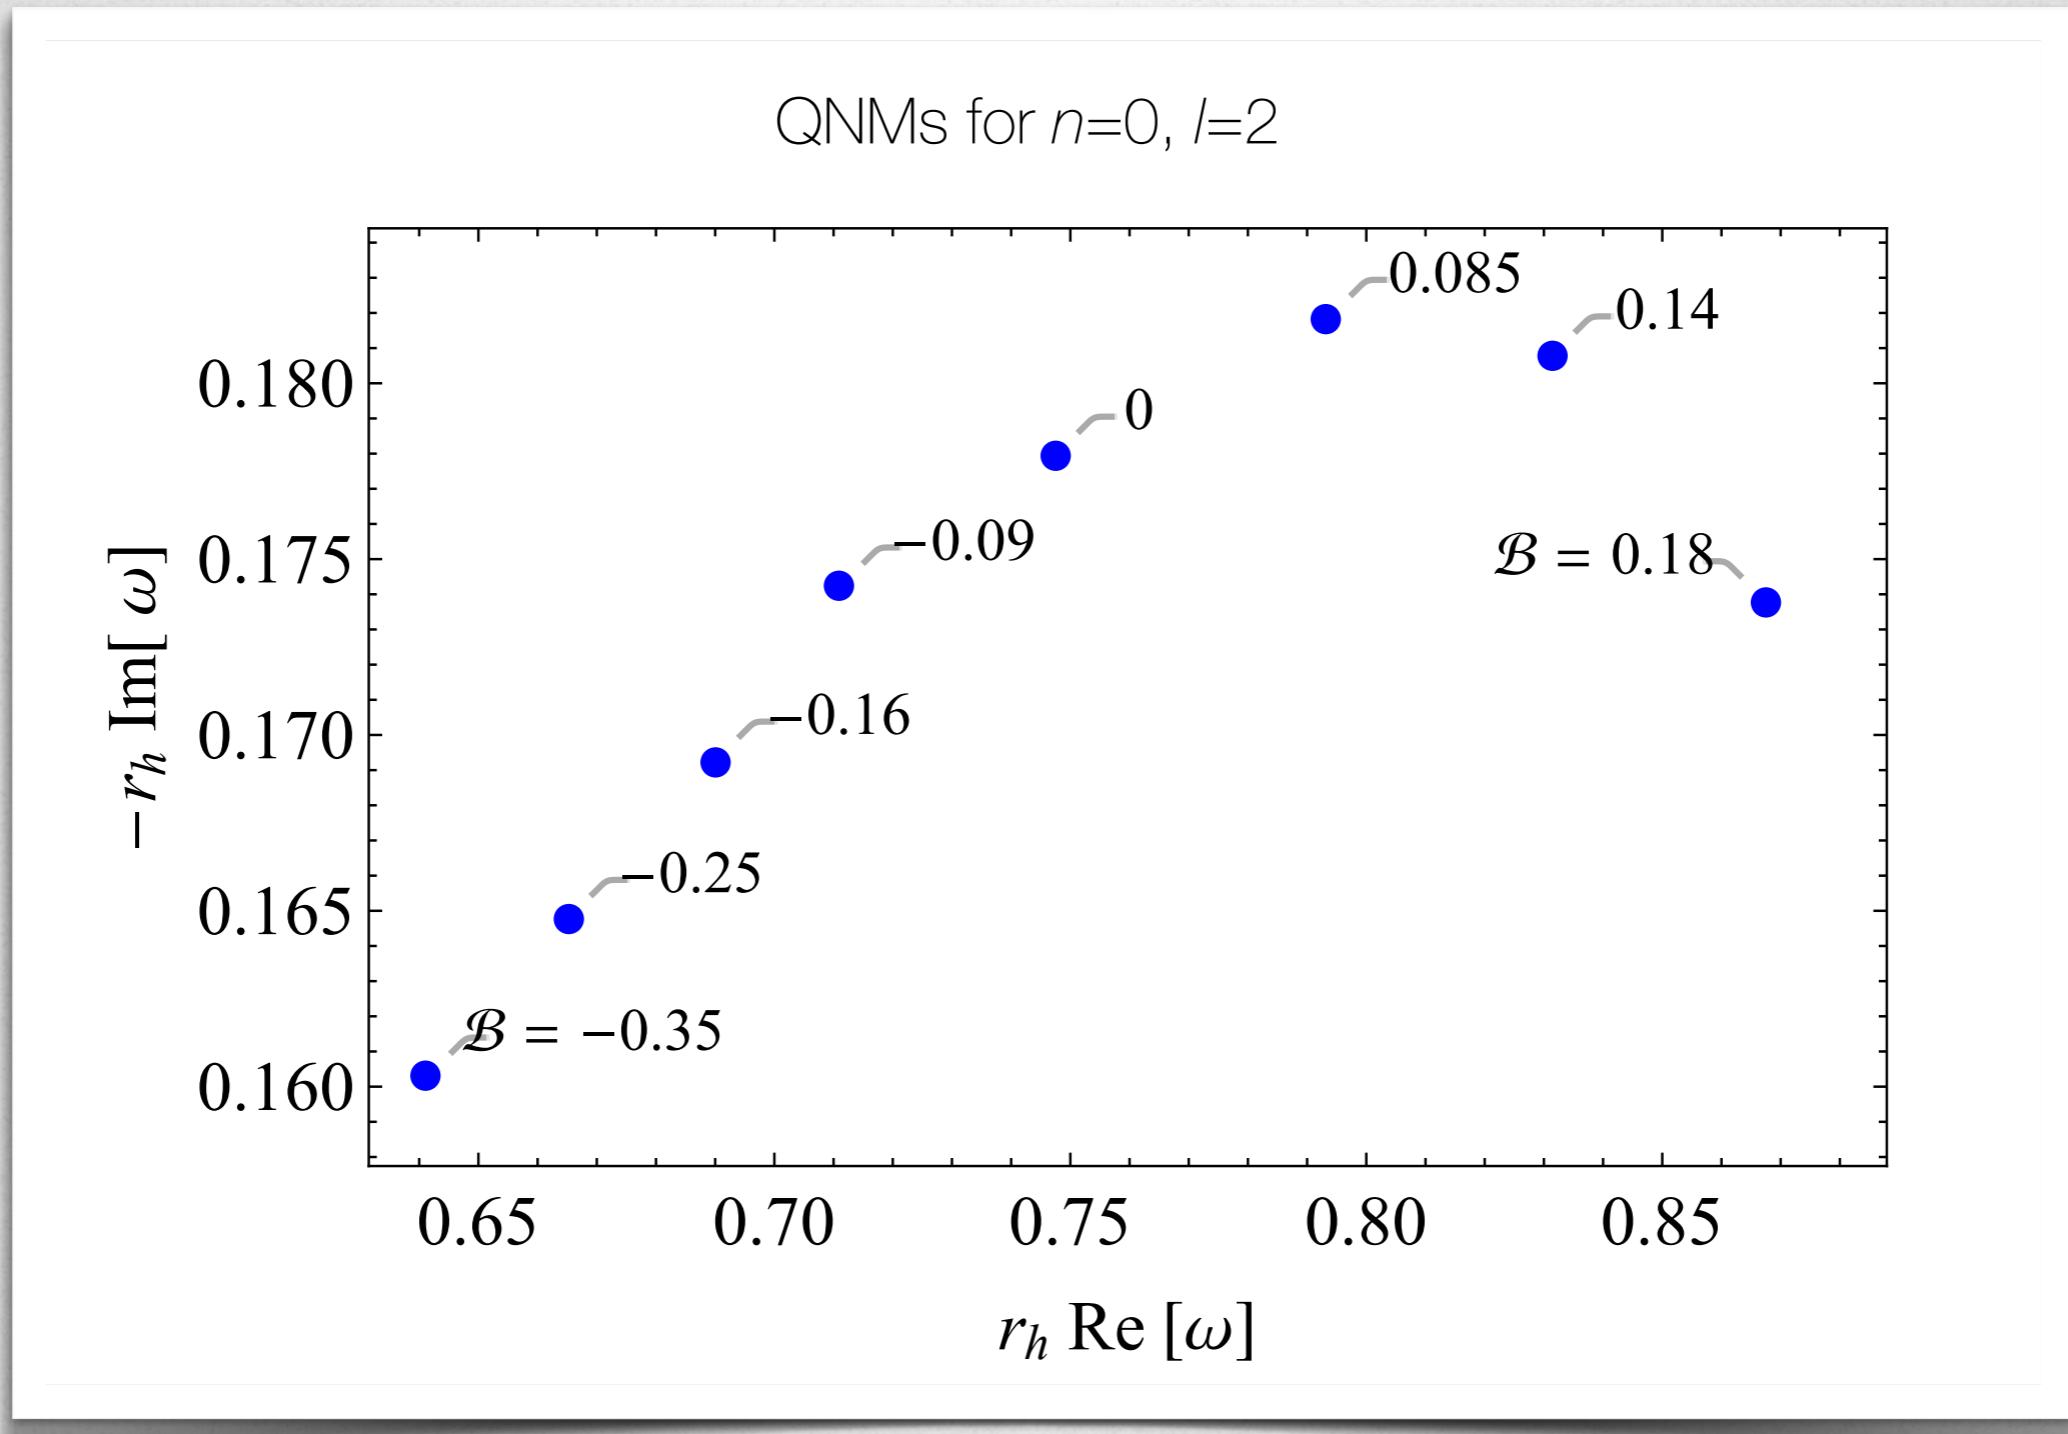

Geometry of Minamitsuji– Edholm solution for gravitons

$$\mathcal{B} < 0$$

Quasi-normal modes

Conclusions

- Odd-parity perturbations of static, spherically symmetric BHs with linearly time-dependent scalar hair in general shift-symmetric scalar-tensor theories
- General form of quadratic Lagrangian and effective metric for odd modes are determined
- Can be applied to cubic DHOST, U-DHOST, and scordatura (detuned DHOST) theories
- Gravitons see different BH geometry
- Refined stability conditions, QNMs, ...
